26/10

# ACTIVITY

1) Technique : Median Filtering

Reason : It removes random black and white dots by replacing each pixel with the median value of neighbouring pixels. ~~Neighbouring~~ It effectively reduces the salt-and-pepper noise and also preserves important image edges.

2) Technique : Gaussian Filtering

Reason : It reduces Gaussian noise by smoothening the neighbouring pixels. This improves the image quality, although some fine details may become blurred.

3) Technique : Bilateral Filtering

Reason : It removes unwanted black and white dots from the document. It also helps preserve letters & characters for better quality & readability.

4) ~~Med~~ Technique : Median Filtering

Reason : It removes unwanted black and white dots from the document. It also helps preserve letters & characters for better quality.

5) Technique : Non - Local Means Denoising

Reason : It reduces heavy noise by comparing similar patterns across the image. It helps preserve important details while improving image clarity.

6) Technique : Histogram Equalization

Reason : It redistributes pixels intensity values to improve image contrast. This makes roads, vehicles and other objects more distinguishable.

7) Technique : Color Correction and Contrast Enhancement

Reason : Color correction improves the balance of colors lost underwater.

Constant enhancement makes underwater objects and marine life more visible.

8) Technique : Dual Energy Subtractions

Reason : It uses X-ray images captured at different energy levels to distinguish bone from soft tissue. This improves the visibility of selected internal structures

9) Techniques : Histogram Equalization

Reason : It redistributes pixels intensities to improve contrast in dark images. This helps make vehicles, pedestrians and road markings more visible.

10) Technique : Contrast Stretching

Reason : It expands the narrow range of pixel intensities across a wider range. This increases the difference between dark, & bright regions making the details clearer.
